```
prior protein. The specification describes a method for the diagnosis of subacute transmissible spongiform encephalopathy (EST) caused by a strain of unconventional transmissible agent. The method comprises detecting abnormal prion protein in a biological sample. The sample is treated with at least one protein as knile retaining at least some of the octapeptide repeats in the prion protein, then treatment with a ligand for octapeptide repeats and detecting any formation of a complex. The method is used to diagnose ESST, particularly (new variant) creuzzfeld-Jakob diseases, bovine spongiform encephalopathy and

The sequences given in AAR38025-36 represent polypeptides derived from an antigenic site, region E, of a prion protein. Prion proteins comprise six regions of interest (A-F), and two related frame shift peptides sequences caused by a repeating section in region E having a nucleic acid coding sequence frame shift mutation of +1 (Fsa) or -1 (Fsb) (see also AR38037-38). These peptides and antibodies raised against these may be used to trevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal form of prion protein (PPPC) and the scrapic-associated form (PPPC). These peptides may include rare or synthetic amino acids or a ratio-inverse peptide modification to improve resistance to enzymatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antigen; prion; protein; region; frame shift; repeat; mutation; PrPC; FSa; FSb; subfragment; antibody; treatment; spongiform encephalopathy, human; sheep; cattle; cellular binding; aggregation; mammal; scrapie; humune system; PrPsc; ratio-inverso peptide; enzymatic degradation;

The sequences given in AAR38025-36 represent polypeptides derived from an antigenic site, region E, of a prion protein. Prion proteins comprise six regions G interest (A-F), and two related frame shift peptides sequences caused by a repeating section in region E having a nucleic acid coding sequence frame shift mutation of +1 (FSa) or -1 (FSb) (see also AAR38037-38). These peptides and antibodies raised against these may be used to treat or prevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal form of prion protein (PPPC) and the scrapic-associated form (PPPC). These peptides may include rare or synthetic amino acids or a ratioinverso peptide modification to improve resistance to enzymatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAR38025-36 represent polypeptides derived from an antigenic site, region E, of a prion protein. Prion proteins comprise six regions of interest (A-F), and two related frame shift peptides sequences caused by a repeating section in region E having a nucleic acid coding sequence frame shift mutation of +1 (FSa) or -1 (FSb) (see also AAR38037-38). These peptides and antibodies raised against these may be used to treat or prevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal form of prion protein (PFPC) and the scraple-associated form (PFPC). These peptides may include rare or synthetic amino acids or a rationary and peptide modification to improve resistance to enzymatic

antiserum against a human or animal prion protein (PrP) which can be used in immunoassays for detecting PrP's. The method comprises (a) selecting a polypeptide that has a length of at least 10 amino acids and has an amino acid sequence at least 70% homologous to that of human, bovine or murine PrP in a region of at least 10 consecutive amino acids and (c) binding a metal to the polypeptide by reaction with a metal compound and (c) injecting the metal-containing polypeptide into a host animal, optionally together with adjuvants, to induce production of a polyclonal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present sequence is the mouse prion protein (PrP) sequence. Conversion of the normal cellular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible Spongiform Encephalopathies (TEEs). Examples of TEEs include Bovine Spongiform Encephalopathy (BSE), scrapie, Creutzfeldt-Jakob disease (CLD) and Gerstmann-Straussler-Speinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is then detected. The presence of PrP indicates TSE. PrP epitopes (AMB07320-B07326) are derived from the protease resistant core of PrP that is occluded when the PrP is in an aggregated state.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        29..69

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps, 0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention claims to provide a method for detecting transmissable spondiform encephalopathies (TSE) in animals and in animal carcasses. The method comprises of an immunological assay whereby the animal test sample is reacted with a labelled antibody against scrapie prion protein (prpSC) and the amount of bound labelled antibody is then detected. The anti-prpSC antibodies used in the assay are raised against fragments of the present synthetic peptide shown. The peptide fragments preferred by the inventors are shown in the features table. The method is claimed to be useful when applied to samples, particularly a cross-section of the spinal cord, from cartile, sheep and pig carcasses for detection of bovine spongiform encephalopathy (BSE) or scrapie.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting pathogenic prion(s) in animal carcasses - by reaction with specific labelled antibody, used to detect those carrying agents for bovine spongiform encephalopathy and scrapie
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Location/Qualiflers

                                                                                                                                                                                                                                                                                                                                 ð
                                                                                                                                                                                                                                                             ö
                                                                                          The present sequence is the human prion protein (PrP) sequence. Conversion of the normal cellular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible Spongiform Encephalopathies (TSES). Examples of TSES include Bovine Spongiform Encephalopathy (BSE), scrapie, Creutzfeldt-Jakob disease (CJD) and Gerstmann-Straussler-Spelinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is them detected. The presence of PrP indicates TSE. PrP epitopes (ABB07320-B07326) are derived from the protease resistant core of PrP that is occluded when the PrP is in an aggregated state.

The present sequence is the mouse prion protein (PrP) sequence. Conversion of the normal callular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible Spondiform Encephalopathies (TRES). Examples of TSES include Bovine Spongiform Encephalopathy (BSE), scrapie, Creutzfeldt-Jakob disease (CID) and Gerstmann-Straussler-Sheinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is then detected. The presence of PrP indicates TSE. PrP epitopes (AMB07320-B07326) are derived from the protease resistant core of PrP that is occluded when the PrP is in an aggregated state.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tandem repeats

                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                                  Spongiform Encephalopathies (TSES). Examples of TSES include Bovine Spongiform Encephalopathy (BSE), scrapie, Creutzfeldt-Jakob disease (CJD) and Gerstmann-Straussler-Sheinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is then detected. The presence of FrP indicates TSE. PrP epitopes (AMB07320-B07326) are derived from the protease resistant core of PrP that is occluded when the PrP is in an adjacegated state.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hamster; Prp; cerebroprotective; PrP conversion inhibitor; prion protein; transmissible spongiform encephalopathy; TSE; neurodegenerative disease; protease-sensitive prion protein; PrPsen; protease-resistant prion protein; PrPsen;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Transmissible spongiform encephalopathies (TSE) are fatal neurodegenerative diseases. These diseases are characterised by the formation and accumulation, in the brain, of an abnormal proteinase K resistant isoform (PrPres) of a normal protease-sensitive host-encoded prion protein (PrPsen). The present invention relates to peptides comprising a hamster, human or murine prion protein (PrP) fragment which specifically inhibit the conversion of protease-sensitive prion protein (PrPsen) to procease-resistant prion protein (PrPres). The present sequence is one such peptide. The peptides of the present invention are
                                   The present sequence is the human prion protein (PrP) sequence. Conversion of the normal cellular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible
                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptide comprises hamster prion protein fragment that inhibits conversion of prion protein from protease-sensitive to protease-resistant form, useful for diagnosis and treatment of spongiform encephalopathies
                                                                                                                                                                                                                                                                                                                                                         Ouery Match

The present sequence represents a prion protein. The specification describes chimeric polypeptides, which comprise at least one SCHAG (self-coalesces into higher-order aggregates) amino acid sequence fused in frame with a polypeptide of interest (which is other than a marker protein, a glutathione-S-transferase or a staphylococcal nuclear protein). The specification also describes chimeric polypeptides that comprises an amyloidogenic domain that causes aggregation into fibrils. The chimeric polypeptides are used to prepare polymers with multiple partners, and useful e.g. for performing multi-step chemical reactions. They can be used create an inducible, or stable phenotypic alteration in a cell, e.g. for gene therapy, protein production, imparting disease resistance to plants, altering plant pigmentation and for diagnosis and treatment of prion diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a prion protein. The specification describes chimeric polypeptides, which comprises at least one SCHAG. (self-coaleasces into higher-order aggregates) amino acid sequence fused in frame with a polypeptide of interest (which is other than a marker protein, a glutathione-S-transferase or a staphylococcal nuclear protein). The specification also describes chimeric polypeptides that comprises an amyloidogenic domain that causes aggregation into fibrils. The chimeric polypeptides are used to prepare polymers with multiple partners, and useful e.g. for performing multi-step chemical reactions. They can be used create an inducible, or stable phenotypic alteration in a cell, e.g. for generation production, imparting disease resistance to plants, altering plant pigmentation and for diagnosis and treatment of prion diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present sequence is the cattle prion protein (PrP) sequence. Conversion of the normal cellular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible spongiform Encephalopathies (TEEs). Examples of TEEs include Bovine Spongiform Encephalopathy (BSE), scrapie, Creutzfeldt-Jakob disease (CDD) and Gerstmann-Straussler-Scheinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is then detected. The presence of PrP indicates BSE. PrP epitopes (ABB07320-807326) and detected from the protease resistant core of PrP that is occluded when the PrP is in an aggregated state.

            Sequence 2, Application US/08692892

Patent No. 5792901

GENERAL INFORMATION:
APPLICANT: Scott, Michael R.
APPLICANT: Scott, Michael R.
APPLICANT: Telling, Glenn
TITLE OF INVENTION: DETECTING PRIONS IN A SAMPLE AND
TITLE OF INVENTION: PRION PREPARATION AND TRANSGENIC ANIMAL USED FOR SAME NUMBER OF SEQUENCES: 4
CORRESPONDENCE ADDRESS:
ADDRESSEE: Karl Bozlcevic
STREET: 2200 Sand Hill Road
CITY: Menlo Park
CRAFF. CA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DB 1; Length 253;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GENERAL INFORMATION:
APPLICANT: Prusiner, Stanley B.
APPLICANT: Prusiner, R. Anthony
APPLICANT: Williamson, R. Anthony
APPLICANT: Burton, Dennis R.
TITLE OF INVENTION: ANTIBODIES SPECIFIC FOR NATIVE PrP
NUMBER OF SEQUENCES: 86
CORRESPONDENCE ADDRESS:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

prion protein - rabbit
C;Species: Oryctolagus cuniculus (domestic rabbit)
C;Species: Oryctolagus cuniculus (domestic rabbit)
C;Accession: JC6175
R;Loftus, B.; Rogers, M.
Gene 184, 215-219, 1997
A;Title: Characterization of a prion protein (PrP) gene from rabbit; a species with a A;Reference number: JC6175; MUID:97183665
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A; MOJECULE type: DNA

protein precursor (PrP) (PrP27-30) (PrP93-35C) (Fragment).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 der Kuyl A.C., Dekker J.T., Goudsmit J.;
Submitted (NOV-1996) to the EMBL/GenBank/DDBJ databases.
-- FUNCTION: THE FUNCTION OF PRP IS NOT KNOWN. PRP IS ENCODED IN THE
HOST GENOME AND IS EXPRESSED BOTH IN NORMAL AND INFECTED CELLS.
-- SUBUNIT: PRP HAS A TENDENCY TO AGGREGATE YIELDING POLYMERS CALLED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -1- SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor.
-1- DISEASE: PRP IS FOUND IN HIGH QUANTITY IN THE BRAIN OF HUMANS AND ANIMALS INFECTED WITH THE DEGENERATUVE NUCOLOGICAL DISEASES KURU, CREDITZFELDY-JAKOB DISEASE (CLD), GERSTMANN-STRAUSSLER SYNDROME (GSS), SCRAPIE, BOVINE SPONGIFORM ENCEPHALOPATHY (BSE), TRANSMISSIBLE MINK ENCEPHALOPATHY (TME), ETC.

```
transduction G-protein coupled receptors designated T2R proteins.
Transduction G-protein coupled receptors designated T2R proteins.
Transduction G-protein coupled receptors designated T2R proteins.
The T2R proteins are taste modulators. The nucleic acids are useful as probes for the identification of taste cells, as the nucleic acids are specifically expressed in taste cells. They also serve as tools for the performance cells. They also serve as tools for the performance cells of the tonger and paste seasors nearest cells of the tonger and generation of taste cells. They also serve as tools for the pharmacological and genetic modulation of taste someon seasors nearest controls in the brain. The taste modulators are useful for pharmacological and genetic modulation of taste signalling pathways.

Modulatory compounds comprising T2R proteins can therefore be used in control of the brain and undustries to customise taste, for e.g. to control of the platter taste of food or drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
Nucleic acids encoding the T2R family of G-protein coupled taste receptors, useful for identifying taste modulators that can be used in food and pharmaceutical industries to customize taste, for e.g. to decrease the bitter taste of food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gáps

Claim 17; SEQ ID NO: 6481; 246pp + Sequence Listing; English.

```
The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium coryneform bacterium. Oryneform bacterium coryneform bacterium. Oryneform bacterium bacterium bacterium parturellary L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis

Claim 11; SEQ ID NO 11154; 3071pp + Sequence Listing; English.

cartivity, and can be used in aMM81210. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that ffect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting protein. (I) proteins and polynucleotides may be used to protein. (C) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic antigen genomic to AAK87694 répresent human immune/haematopoietic antigen genomic sequences from the present invention. AAK85491 to AAK87690 and AAM82169 represent sequences used in the exemplification of the present invention. AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polyneptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, ac; stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/lihibin activity and may be useful in the diagnosis and/or the annual control of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                     Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; hmwunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The present invention provides the protein and coding sequences of a number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendictis, Hirschaptung's disease, chronic colitis or ulcerative colitis. The present sequence is a digestive system antigen of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                 Polynucleotides encoding digestive system antigens, useful for diagnosing, treating, preventing and/or prognozing disorders of the digestive system, particularly cancer and cancer metastases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ő

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Protein #7377 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples, derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences.

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21355-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human brain expressed single exon probe encoded protein SEQ ID NO: 34479
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; brain expressed exon; gene expression analysis; probe; microarray; Alzhelmer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.

(SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                             Peptide #6962 encoded by probe for measuring cervical gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to human single exon nucleic acid probes
                                                                                                                                                                                                                                                                                                                                                                                                     human; microarray; gene expression; cervical epithelial cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 31; DB 22; I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple scierosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present sequence is a conserved sequence from Caenorhabditis elegans and Homo sapiens. A number of C. elegans proteins have been identified that have mammalian homologues acting in the insulin signaling pathway. The C. elegans age-1 gene encodes a homologue of the mammalian PI s-kinase whilst daf-2 encodes a homologue of the mammalian Insulin receptor. The C. elegans AKT kinase and PKB kinase act downstream of daf-2 and age-1, just as their mammalian homologues act downstream of insulin signalling. The C. elegans PTEN lipid phosphatase homologue. DAF-18, has been found to act upstream of AKT in the pathway. This discovery has enabled mammalian PTEN action to be mapped to the insulin signalling pathway. Conserved DAF motifies can be used to design probes to identify mammalian DAF homologues and thus to identify individuals with a predisposition towards the development of glucose intolerance conditions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                      Peptide #9330 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Caenorhabditis elegans; human; daf-18; insulin signalling pathway; daf-2; age-1; insulin receptor; PI 3-kinase; PKB kinase; PTEN lipid phosphatase; antidiabetic; anorectic; obesity; diabetes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          23-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    29-JUN-1999
                                                                                                                                                                                                                                                                                                         16-JUN-1
  *************************
                                                                                                                                                                                                                                                                                                       ö
                                                                                         The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                        Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                       Gaps
                              Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune

```

```
The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to sytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 20; SEQ ID NO 22075; 1399pp + Sequence Listing; English.

```
CC peptide therapy. The polypeptides have various cytokine-like activities, CC e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and cartivity and may be useful in the diagnosis and/or creatment of cancer, leukaemia, nervous system disorders, arthritis and CC inflammation.

CC inflammation.

CC specification, but was obtained in electronic format directly from WIPO CC at ftp.wipo.int/pub/published_pct_sequences.
